

Infinity Book

A free-to-play cricket and social casino gaming platform for the Indian market — built to rank, built to last, built to stay on the right side of the law.

SCOPE OF THIS DOCUMENT

Complete website structure, page-by-page layout, design system, technical architecture, live cricket score integration, and SEO strategy. Written to be handed directly to a web development team.

PROJECT	Infinity Book — Social Gaming Platform
MARKET	India (national)
MODEL	Free-to-play. No deposits, no cash payouts.
DOCUMENT	v1.0 — Design & Developer Handoff
DATE	23 July 2026

CONTENTS

What's in this document

01	The Compliance Model — Read This First	The rules the whole build sits on
02	Brand Advisory	A naming issue worth solving now
03	Business & Monetisation Model	How the platform makes money
04	Information Architecture	Full sitemap and URL structure
05	Page-by-Page Specification	Every screen, section by section
06	Wireframes	Desktop and mobile layouts
07	Design System	Colour, type, components
08	Technical Architecture	Stack, hosting, data flow
09	Live Cricket Score Integration	Providers, architecture, legal notes
10	Game Integration	Build vs licence
11	SEO Strategy	The reason this model wins
12	Analytics & KPIs	What to measure
13	Build Roadmap	Phased delivery plan
14	Developer Handoff Checklist	Sign-off before launch
15	Open Questions for the Client	Decisions still needed

HOW TO USE THIS DOCUMENT

Sections 1–3 are for the client — they explain what is being built and why. Sections 4–14 are for the development team. Section 15 lists decisions that must be made before Phase 1 begins.

SECTION 01

The Compliance Model — Read This First

Every design decision in this document follows from one constraint. Understand this section and the rest of the build makes sense.

India's **Promotion and Regulation of Online Gaming Act, 2025** and the accompanying **Online Gaming Rules, 2026** came into force on **1 May 2026**. The Act prohibits "online money games" — any game where a user pays or deposits money in the expectation of winning money — regardless of whether the game depends on skill or chance. There is no licence available and no skill-based exemption.

Critically for everyone working on this project: **offering, advertising, promoting, and facilitating payments** for such games are each separate criminal offences, and they are cognisable and non-bailable. Enforcement has been directed at operators, advertisers, promoters and influencers rather than at players.

The Act does, however, expressly permit "**online social games**" — games played for entertainment, without stakes and without monetary payouts. That is the category Infinity Book is built in, and it is a large, proven, profitable global category.

THE FIVE NON-NEGOTIABLE BUILD RULES

1. **No deposits of real money for gameplay stakes.** Users may purchase virtual coins as a consumable in-app product, but coins are a product they consume, not a balance they stake for a monetary return.
2. **No cash payouts, ever.** Coins, XP and trophies cannot be converted to money, transferred to another user, or redeemed for cash-equivalent instruments. There is no withdrawal function anywhere in the product.
3. **No odds and no wagering vocabulary.** No decimal or fractional odds, no lines, no spreads, no "bet", "stake", "wager", "cashout", "payout", "bookmaker" or "punter" anywhere in the UI, the URLs, the metadata, or the marketing.
4. **No betting affiliate links or advertising.** Not in the footer, not in the blog, not in a banner, not in an email. Carrying a betting affiliate link is itself the promotion offence, and it would also poison the domain for search.
5. **18+ gate and responsible-play controls.** Age declaration at registration, session-time reminders, daily play limits, and a self-exclusion option. Simulated casino content should be treated as adult content even when it is free.

THE SINGLE BIGGEST RISK TO THIS PROJECT

The most common way a free-to-play platform loses its protection is **feature creep after launch** — a "VIP cash tournament", a "withdraw your winnings" pilot, a betting partner in the footer. Any one of these converts a lawful product into an unlawful one overnight and exposes the operator, the marketer and the developer. Put rules 1–4 into the development contract as hard constraints, not preferences.

What this means commercially

This is not a watered-down version of the original plan — it is a structurally better business. A blocked betting domain loses its accumulated search authority the moment it is taken down, forcing a restart on a mirror domain. A compliant social gaming

platform can build domain authority for years, run Google and Meta ads, appear in the Play Store and App Store, hold a normal payment gateway relationship, and be sold as an asset. The audience is identical; only the monetisation mechanism differs.

SECTION 02

Brand Advisory

One recommendation before any design work is signed off.

In the Indian and international gambling market, **"Book" means bookmaker**. "Infinity Book" reads unambiguously as a betting brand — that is almost certainly why the name was chosen. For this platform it is now a liability rather than an asset, for four practical reasons:

RISK	CONSEQUENCE
App store rejection	Apple and Google both screen social casino submissions against real-money gambling policy. A bookmaker-signalling name materially raises the chance of rejection or extended review.
Ad account rejection	Google Ads and Meta gambling policy classifiers act on brand naming. A rejected ad account is difficult to reinstate.
Payment gateway refusal	Indian gateways and their acquiring banks screen merchant names for gambling signals. This can block coin sales entirely.
Enforcement attention	Blocking orders are issued in bulk against betting-signalling domains. A lawful site with a bookmaker name may be caught in a sweep and require a costly appeal to be unblocked.

Recommendation

Keep the equity in "Infinity" and drop the bookmaking signal. Options that preserve brand recall while clearing the classifiers:

- **Infinity Play** — clearest signal of the actual product category
- **Infinity Arena** — works for both cricket and games lobby
- **Infinity Games** — plainest, safest, best for app store search
- **Infinity Club** — premium positioning, good for a VIP tier

IF THE CLIENT INSISTS ON RETAINING "INFINITY BOOK"

Register and build on the safer domain, and hold the original as a redirect only. Do not make "Infinity Book" the app store listing name, the merchant name on the payment gateway, or the brand in ad copy. The rest of this specification applies unchanged — every layout, component and SEO recommendation is name-agnostic.

The remainder of this document uses **"Infinity"** as the working brand name.

SECTION 03

Business & Monetisation Model

Four revenue streams, none of which require a user to stake money.

STREAM	HOW IT WORKS	SHARE OF REVENUE
Virtual coin sales	Users receive free daily coins. Impatient or heavy players buy coin packs as a one-off consumable purchase. Priced in tiers from ₹49 to ₹2,499. This is the primary revenue driver in social casino globally.	50–60%
Rewarded & display advertising	Rewarded video ("watch to refill coins"), interstitials between game rounds, and display units on the cricket content pages. Google AdMob / AdSense plus a programmatic partner.	20–30%
Subscription (Infinity Club)	Monthly tier at ₹149–₹299: ad-free experience, larger daily coin grant, exclusive tables and games, profile badge, early access to new titles.	10–15%
Sponsorship & branded content	Cricket season sponsorships, branded prediction contests, sponsored leaderboards. Requires audience scale first — realistic from month 9 onward.	5–10%

The engagement engine

Free-to-play economics depend on daily return, not on transaction size. The product must be designed so a user has a reason to open it every day even when they spend nothing:

- **Daily coin grant** with an escalating streak bonus — the single highest-impact retention mechanic
- **Live cricket as the daily hook** — during a match, users check the score; the games lobby is one tap away
- **Free-to-enter prediction contests** tied to live matches, with leaderboard placement and non-cash prizes (badges, coin grants, merchandise)
- **Weekly and seasonal leaderboards** with visible ranks and tiers
- **Missions and achievements** that reward exploration across both cricket and games

PRIZE STRUCTURES NEED A LAWYER'S SIGN-OFF

Free-entry contests with physical or merchandise prizes are generally lawful, but the structure interacts with state prize-competition and lottery legislation, which varies. Before launching any contest with a prize of material value, have an Indian gaming lawyer review the specific mechanic and the terms. Budget for this — it is a small cost against the risk.

SECTION 04

Information Architecture

The sitemap is designed so that the search-visible content layer and the logged-in product layer reinforce each other.

URL rules for the development team

- Lowercase, hyphen-separated, no trailing parameters on indexed pages
- Slugs are stable and permanent — never regenerate a player or match slug; if a name changes, add a 301 and keep the original
- No betting vocabulary in any URL path, ever — this includes /odds/ , /tips/ , /betting/ , /prediction-tips/
- Every /account/ and /games/ gameplay route returns noindex ; the games lobby and individual game description pages are indexed
- Canonical tags on every programmatic page, self-referencing by default

SECTION 05

Page-by-Page Specification

Sections listed in render order, top to bottom. Mobile-first — the mobile order is the canonical order.

5.1 Homepage

Job: convert a cold search visitor into a registered player, and give a returning player a one-tap route to the thing they came for.

SECTION	CONTENTS & NOTES
Sticky header	Logo, primary nav (Cricket / Games / Predict / Leaderboard), coin balance chip (logged in) or Login + Sign Up (logged out). Search icon.
Live match strip	Horizontally scrollable cards of live and upcoming matches. Score, overs, teams, status. Tapping opens match centre. This is the single most valuable element on the page — it drives daily return.
Hero	Single clear value proposition and one primary CTA ("Play free — get 10,000 coins"). Explicitly states "100% free to play. No deposits. No cash prizes." — this is both a trust signal and a compliance statement.
Quick play tiles	Six game tiles: the three most popular titles plus three cricket-themed. Large touch targets.
Live prediction promo	Active free contest tied to the current match, with entrant count and time remaining.
Games by category	Cricket · Cards · Slots · Table. Each row a horizontal scroller with "See all".
Leaderboard preview	Top 5 of the current weekly board plus the logged-in user's own rank. Rank visibility is a powerful retention mechanic.
Latest cricket content	Four most recent articles or match reports. Feeds the SEO layer and gives crawlers a fresh internal link path.
Trust band	Free-to-play badge, 18+ badge, responsible play link, certified RNG badge (once obtained).
SEO content block	250–400 words of genuine descriptive copy about the platform. Placed below the fold, above the footer. Not keyword stuffing — real copy.
Footer	Full sitemap links, legal pages, responsible play, social, app store badges. No betting links of any kind.

5.2 Match Centre — `/cricket/match/[slug]/`

Job: the highest-traffic page type on the site during any major match. Must load fast and update without a refresh.

- **Score header (sticky on scroll):** both teams, score, overs, run rate, required rate, match status, venue, toss result
- **Tab bar:** Live · Scorecard · Commentary · Squads · Stats · H2H
- **Live tab:** current batters with strike indicator, current bowler, last 12 balls as a visual over strip, partnership, fall of wickets

- **Scorecard tab:** full batting and bowling cards for both innings, extras, fall of wickets table
- **Commentary tab:** reverse-chronological ball-by-ball, virtualised list, auto-appending via WebSocket
- **Contextual prediction CTA:** inline card offering the free contest for this match — this is the conversion bridge from content layer to product layer, and it is the most important commercial element on the page
- **Below the fold:** match preview or report article, related matches, venue stats

5.3 Games Lobby — </games/>

- Filter bar: category, popularity, newest, "playable with current coins"
- Game card grid: thumbnail, title, category tag, player count, "Free" badge
- Continue playing rail for returning users (personalised, above the grid)
- Coin balance always visible with a "Get more coins" route to rewarded video first, purchase second
- Each game card links to an indexed game description page containing rules, strategy and a screenshot — these rank for "how to play X" queries

5.4 Prediction Contest — [/predict/contest/\[id\]/](/predict/contest/[id]/)

- Contest header: match, entry "Free", entrant count, closing time, prize (coins / badge / merchandise)
- Question set: 5–10 multiple-choice questions ("Top run scorer", "Total match sixes — over/under 12")
- Explicit banner: "Free entry. No purchase required. No cash prizes."
- Post-lock: live scoring against actual match events, live rank movement
- Results and leaderboard on match completion, with share cards for organic distribution

5.5 Account & Coins — </account/coins/>

DESIGN CONSTRAINT FOR THIS PAGE SPECIFICALLY

This screen must contain **no withdrawal control, no bank field, no UPI payout field, and no cash-value display**. Coins are never shown with a rupee equivalent. The purchase flow buys a coin pack at a stated rupee price; it does not "top up a balance". Wording matters here — have the copy reviewed alongside the terms.

- Coin balance, lifetime coins earned, current streak
- Coin pack purchase tiles with clear one-time consumable framing
- Free coin routes listed first: daily grant, rewarded video, missions, streak bonus
- Transaction history (purchases and grants)
- Prominent link to </account/play-limits/>

5.6 Responsible Play — </responsible-play/>

Not a boilerplate legal page. It should carry real functionality and be linked from the footer of every page and from the coins screen: session-time reminder settings, daily play-time cap, coin-purchase monthly cap, self-exclusion for 7/30/90 days, and links to independent support resources. This page is also a meaningful trust and app-review signal.

SECTION 06

Wireframes

Low-fidelity layout intent. Proportions are indicative; the design system in Section 07 governs final appearance.

6.1 HOMEPAGE — DESKTOP (1440PX)

Note the ordering logic: live scores sit above the hero. A returning user's reason to open the site is served before the marketing message.

6.2 HOMEPAGE — MOBILE (390PX)

Sticky bottom navigation is essential — the majority of traffic will be mobile, and Play must never be more than one tap away.

6.3 MATCH CENTRE

The prediction CTA placement is deliberate: immediately below the live panel, where attention is highest during a match.

6.4 GAMES LOBBY

SECTION 07

Design System

A dark, premium interface. Dark UI reads as high-production-value in the gaming category and makes live score data and game art the visual focus.

CORE PALETTE

#F2F5F8

Text muted

#8695A6

COLOUR USAGE RULE

Green is for primary actions and positive states. Gold is reserved exclusively for coins, rewards and the Club tier — never for CTAs, or the coin economy loses its visual distinctiveness. Red is reserved for the live indicator and destructive actions only.

TYPOGRAPHY

ROLE	FACE	SIZES & USAGE
Display	Clash Display or Satoshi (variable)	40 / 32 / 24px. Hero headlines, section titles. Tight tracking (–1%).
Interface	Inter (variable)	18 / 16 / 14 / 12px. All body, navigation, labels. Excellent Devanagari companion if Hindi localisation follows.
Numeric	Inter, tabular-nums	Scores, coin balances, timers, leaderboard ranks. <code>font-variant-numeric: tabular-nums</code> is mandatory — non-tabular figures cause visible jitter on live-updating scores.

SPACING, RADII, ELEVATION

- Spacing scale: 4 / 8 / 12 / 16 / 24 / 32 / 48 / 64px. No arbitrary values.
- Radii: 8px cards, 12px panels, 999px pills and chips, 6px inputs
- Elevation via surface lightening rather than heavy shadow — shadows read poorly on dark UI
- Minimum touch target 44×44px. Game tiles no smaller than 96×96px on mobile.

COMPONENT INVENTORY FOR THE BUILD

COMPONENT	STATES & VARIANTS REQUIRED
Live match card	Live (pulsing red dot) · Upcoming (countdown) · Completed (result) · Abandoned
Game tile	Default · Hover · Locked (insufficient coins) · New badge · Playing-now count
Coin chip	Default · Increment animation · Low-balance warning state
Score header	First innings · Second innings (with required rate) · Break · Result
Over strip	Per-ball tokens: dot, 1–6, W, WD, NB, LB, B
Leaderboard row	Default · Own-rank highlight · Top-3 medal treatment · Rank movement arrow
Contest card	Open · Locked · Live scoring · Settled
Buttons	Primary · Secondary · Ghost · Destructive — each with loading and disabled
Empty & error states	No live matches · Feed unavailable · No contests · Offline. These must be designed, not left to the developer.

ACCESSIBILITY (NON-OPTIONAL)

- Minimum 4.5:1 contrast on all text — verify the muted grey on dark surfaces, which commonly fails
- Never encode meaning in colour alone — the live indicator needs a "LIVE" label, not just a red dot
- Full keyboard navigation and visible focus rings
- Respect `prefers-reduced-motion` — critical given the volume of animation in the coin and game UI
- Score updates announced via `aria-live="polite"`

SECTION 08

Technical Architecture

LAYER	RECOMMENDATION	REASONING
Frontend	Next.js 15 (App Router), TypeScript, Tailwind	Server-side rendering and incremental static regeneration are non-negotiable given SEO is the primary acquisition channel. A client-rendered SPA will not rank for the programmatic pages.
Rendering strategy	ISR for content, CSR for gameplay	Player, venue, record and H2H pages regenerate on a schedule. Match centre uses SSR shell plus WebSocket hydration. Game canvas is fully client-side and noindexed.
Backend	NestJS (Node/TypeScript)	Shared types with the frontend, strong WebSocket support, good structure for a team handoff.
Database	PostgreSQL	Users, coin ledger, contests, game sessions, content. The coin ledger must be append-only and auditable.
Cache / realtime	Redis + Socket.IO	Redis caches the score feed and backs the leaderboard sorted sets. Socket.IO fans out score and contest updates.
CDN & edge	Cloudflare	Static asset delivery, image optimisation, DDoS protection, bot management. Meaningful cost saving on game asset bandwidth.
Hosting	Vercel (frontend) + AWS ap-south-1 (backend)	Mumbai region for latency. India-resident data storage also simplifies DPDP Act compliance.
Auth	Phone OTP primary; Google OAuth secondary	Phone-first matches Indian user expectation and enables duplicate-account control on contests.
Payments	Razorpay or Cashfree	For coin pack purchases and subscription only. Disclose the product accurately at merchant onboarding — describe it as virtual goods for a free-to-play game, never as gaming credits.
Analytics	GA4 + Mixpanel/PostHog + Search Console	GA4 for acquisition, product analytics for the retention loop, Search Console for the SEO layer.

PERFORMANCE BUDGET (ENFORCE IN CI)

- Largest Contentful Paint under 2.0s on 4G — the live score strip must be in the server-rendered HTML, not fetched client-side
- Interaction to Next Paint under 200ms
- Cumulative Layout Shift under 0.1 — reserve fixed height for the score strip and all ad slots; ad-driven layout shift is the most common CLS failure on this kind of site
- Initial JS bundle under 200KB gzipped on content routes; game bundles lazy-loaded on demand only

- Content pages must be fully readable and useful with JavaScript disabled

DATA PROTECTION

India's Digital Personal Data Protection Act applies. Required: explicit consent capture at signup with a clear notice, a data deletion route in account settings, India-resident storage of personal data, a named grievance officer with contact details published on the site, and a documented breach notification procedure. Build the deletion endpoint in Phase 1 — retrofitting it is significantly harder.

SECTION 09

Live Cricket Score Integration

This was a specific question from the client. The short answer: licence a commercial feed, and never let the browser talk to it directly.

PROVIDER COMPARISON

PROVIDER	INDICATIVE COST	ASSESSMENT
Entity Sport	Low-mid	Recommended starting point. India-focused, strong domestic and IPL-tier coverage, ball-by-ball, well-documented REST API, pricing suited to a launch-stage product.
Roanuz (CricketAPI)	Low-mid	Strong alternative. Good historical data depth, which matters for the programmatic player, venue and records pages. Clean documentation.
Sportradar	High	Premium accuracy and latency, deepest coverage. Appropriate at scale, expensive at launch. Consider from year two.
Stats Perform / Opta	High	Best-in-class analytics and advanced metrics. Overkill unless building a genuine stats product.
CricAPI	Very low	Usable for prototyping only. Latency and reliability are not adequate for a production live match centre.

DO NOT SCRAPE

Scraping Cricbuzz, ESPNcricinfo or a broadcaster feed is not a viable shortcut. Ball-by-ball score dissemination has been directly litigated in India in the context of broadcast and media rights, and scraping additionally exposes the project to copyright and terms-of-service claims. A licensed feed costs less than a single legal notice and is more reliable. Retain the licence agreement — it is also useful evidence of a legitimate operation if the domain is ever caught in a blocking sweep.

INTEGRATION ARCHITECTURE

The browser must never hold the API key or call the provider directly. Doing so leaks the credential, breaches most provider licences, and multiplies request cost by the number of concurrent users.

```
Provider API
| backend polls: 5s during live play, 60s otherwise
▼
Ingestion worker (NestJS scheduled job)
| normalises payload to internal schema, diffs against last state
▼
Redis (current match state, TTL-backed)
|
|→ REST endpoint → SSR initial page render (fast first paint, SEO-visible)
```

- **Poll the provider once, serve many.** One backend poll serves every connected user. Never scale provider calls with user count.
- **Push deltas, not full payloads.** Sending the entire scorecard every five seconds is wasteful on Indian mobile data and will hurt retention.
- **Room-scoped sockets.** A user watching one match receives only that match's events.
- **Persist to PostgreSQL on completion** — completed scorecards become permanent indexed content and feed the stats pages.
- **Design the failure state.** Feeds go down, especially at peak. Show last-known score with a visible timestamp and a "reconnecting" indicator. Never show a blank panel or a stale score presented as live.
- **Cache aggressively at the edge.** Completed match pages are static and should be served from Cloudflare, not regenerated.

ATTRIBUTION

Most providers require visible attribution. Confirm the exact wording required in the licence and place it in the match centre footer. This is a contractual obligation, not a design preference.

SECTION 10

Game Integration

BUILD VERSUS LICENCE

Do not build a game library from scratch. It is the fastest way to burn the budget before launch. The recommended approach is a hybrid:

APPROACH	APPLICATION
Licence a social casino content pack	Slots, table games and card games. Several providers licence social (non-wagering) versions of their catalogues on revenue share or flat fee. This fills the lobby on day one. Confirm in writing that the build supplied is the social, non-wagering variant with no real-money hooks in the client.
Build 2–3 proprietary cricket games	This is the differentiator and the reason a user picks Infinity over a generic social casino. Phaser 3 or PixiJS, HTML5 canvas, mobile-first. Candidates: a batting/timing arcade game, a bowling accuracy game, and a card-based team-building game.
Build the prediction engine in-house	Tightly coupled to the live score feed and the contest scoring logic. Not something to outsource.

TECHNICAL REQUIREMENTS FOR ANY GAME, LICENSED OR BUILT

- HTML5, no Flash, no native plugin dependency
- Runs at 60fps on a mid-range Android device — this is the actual target hardware, not a flagship phone
- Assets lazy-loaded per game; nothing in the initial bundle
- Server-authoritative outcomes. Never let the client determine a result, even without money involved — client-authoritative games are trivially cheated and leaderboards become worthless
- Coin transactions written to the append-only ledger with an idempotency key
- Graceful handling of connection loss mid-round

WORTH DOING: INDEPENDENT RNG CERTIFICATION

Certification is not legally required for a free-to-play product, but obtaining it from an established testing house is inexpensive relative to its value. It strengthens app store review submissions, supports the "genuine social game" characterisation if the platform is ever questioned, and is a real trust signal to display in the footer.

SECTION 11

SEO Strategy

This is where the compliant model decisively outperforms the original plan. A blocked betting domain restarts from zero every time it is taken down. This site compounds.

WHY THIS SITE CAN RANK WHERE A BETTING SITE CANNOT

- It can be submitted to Search Console and indexed normally, with no risk of a blocking order removing the domain
- It can run Google Ads and Meta ads, so paid and organic reinforce each other
- It can earn genuine editorial links from cricket media, which betting sites structurally cannot
- It can appear in the Play Store and App Store, which drives branded search volume
- Its content is genuinely useful, which is what actually sustains rankings over time

KEYWORD ARCHITECTURE

CLUSTER	INTENT	TARGET PAGES & APPROACH
Live scores	Navigational, enormous volume, extremely competitive	Match centre and live scores hub. Realistically a year-two target against incumbents — but it drives the daily-return habit even at low ranking, and long-tail match-specific queries are winnable much sooner.
Player & team	Informational, high volume, moderate difficulty	Programmatic player and team pages. Stats, career records, recent form, upcoming fixtures. The single largest opportunity.
Records & stats	Informational, high volume, low difficulty	"Most sixes in T20 internationals", "highest partnership at Eden Gardens". Underserved and highly linkable. Start here.
Head-to-head	Informational, seasonal spikes	Programmatic H2H pages. Spike hard before every fixture. Cheap to generate, reliable traffic.
How to play	Informational, commercial adjacent	Game description pages: rules, variants, strategy for rummy, teen patti, poker. Converts directly into registrations.
Free games	Transactional	Lobby and category pages. "Play free rummy online", "free cricket games". Strong commercial intent, and the "free" qualifier is genuinely accurate here.

KEYWORDS THAT MUST NEVER BE TARGETED

No betting, odds, satta, wagering, "best betting site", "prediction tips" or cash-prize terminology — in content, metadata, alt text, or schema. Beyond the legal exposure, targeting them signals to Google that this is a gambling site and invites the same treatment. The clean topical profile is the competitive advantage; protect it.

PROGRAMMATIC SEO — THE VOLUME ENGINE

Roughly 3,500 quality pages can be generated from the licensed data feed:

- **Players (~2,000):** profile, career stats by format, recent form, milestones, upcoming fixtures
- **Venues (~400):** stats, pitch history, highest and lowest totals, records at the ground
- **Head-to-head (~800):** all-time record, recent meetings, top performers
- **Records (~300):** filterable, sliceable statistical leaderboards

Quality control is what determines whether this works or backfires. Thin, templated pages will be treated as spam. Each page needs a genuinely unique data payload, at least 150 words of contextual copy generated from real data points rather than filler, internal links to related entities, and current data. Set a minimum-data threshold and `noindex` anything below it — a player with four recorded matches does not warrant an indexed page.

SCHEMA MARKUP

- `SportsEvent` on match pages · `SportsTeam` · `Person` (athlete) on player pages
- `VideoGame` on game description pages
- `Organization` with `sameAs` social profiles sitewide
- `BreadcrumbList` on every page · `FAQPage` where genuine Q&A exists
- `Article` with author markup on editorial content

CONTENT AND LINK STRATEGY

- **Match previews and reports** published within 30 minutes of every significant fixture — publishing speed is the ranking factor that matters most here
- **Seasonal calendar** built around IPL, international tours, T20 and ODI World Cups. Pages should be built and indexed 6–8 weeks ahead of each event, not on the day
- **Original statistical analysis** — the most reliable route to earning links from cricket media, who need data to cite
- **Hindi localisation from Phase 2** with proper `hreflang`. Large volume, dramatically lower competition. This is one of the highest-return items in the whole plan.
- **Digital PR:** pitch original data findings to cricket publications. Do not buy links — a paid-link penalty is far more damaging than slow growth.

TECHNICAL SEO CHECKLIST

- XML sitemap index, segmented by type, auto-regenerating, submitted to Search Console
- Self-referencing canonicals; `noindex` on all gated and gameplay routes
- Server-rendered content on every indexed page — verify by disabling JavaScript
- Internal linking: every player links to their team, recent matches, and venue records
- 301 map maintained for any slug change; broken internal links checked weekly in CI
- Core Web Vitals monitored in Search Console, not only in Lighthouse

SECTION 12

Analytics & KPIs

METRIC	TARGET BY MONTH 6	WHY IT MATTERS
Day-1 retention	35%+	The clearest early signal of whether onboarding and the first play session work
Day-30 retention	12%+	Determines whether the business compounds or leaks
DAU / MAU ratio	0.20+	Habit strength. The daily coin grant and live scores are the levers.
Paying user conversion	1.5–3%	Normal range for social casino. Below 1% indicates a coin economy that is too generous or too punishing.
ARPPDAU	₹1.50–₹3.00	Combined revenue per daily active user across ads, coins and subscription
Organic sessions	150k+/month	The primary acquisition channel; validates the SEO investment
Content → product rate	8%+	The most important metric in this document. The percentage of cricket content visitors who reach a game or contest. If this is low, the two halves of the site are not connected and the SEO traffic is not converting.

INSTRUMENT THESE EVENTS FROM DAY ONE

Registration funnel steps · first game start · first game completion · daily coin claim · streak length · rewarded video completion · coin pack view and purchase · contest entry · match centre view · content-to-game navigation (with source page) · play-limit setting changes.

SECTION 13

Build Roadmap

PHASE 0 — FOUNDATIONS

2–3 weeks

Legal review of the model and the terms by an Indian gaming lawyer. Brand and domain decision (see Section 02). Score feed provider selected and contracted. Design system built in Figma. Repository, CI and environments provisioned.

Gate: do not begin development until the legal review is signed off in writing.

PHASE 1 — CORE PLATFORM

8–10 weeks

Homepage · cricket live scores hub and match centre · score feed ingestion and WebSocket layer · authentication · coin ledger · account and coins screens · responsible play controls · 3–5 launch games · all legal and trust pages · analytics instrumentation · DPDP consent and deletion flows.

Ships as: a working, monetisable product.

PHASE 2 — GROWTH ENGINE

6–8 weeks

Programmatic page generation (players, venues, H2H, records) · prediction contest engine · leaderboards · blog and editorial CMS · full schema markup · rewarded video integration · subscription tier · Hindi localisation.

Ships as: the SEO acquisition machine.

PHASE 3 — SCALE

8–12 weeks

Native apps (React Native or Capacitor wrapper) · expanded game library · social features (friends, private tables, sharing) · missions and achievements system · personalisation and recommendation · RNG certification · brand sponsorship inventory.

Total to a competitive product: approximately 6–8 months. Phase 1 alone is a legitimate soft-launch, and the SEO layer in Phase 2 should begin as early as possible — indexed content takes months to mature, so every week of delay pushes the traffic curve back by more than a week.

SECTION 14

Developer Handoff Checklist

Sign-off items before launch. The compliance block is not optional and should be verified by someone other than the developer who built it.

COMPLIANCE

- ☐ No withdrawal, payout, or cash-conversion function exists anywhere in the codebase — verified by search, not by memory
- ☐ No odds, lines, spreads, or wagering vocabulary in UI copy, URLs, metadata, alt text, or schema
- ☐ No betting affiliate links or advertising in any surface, including the blog and email templates
- ☐ 18+ gate present at registration; responsible play controls functional
- ☐ Coins cannot be transferred between users or converted to any cash equivalent
- ☐ Legal pages published: terms, privacy, refund, responsible play, no-real-money policy, virtual currency policy
- ☐ Terms reviewed and approved by an Indian gaming lawyer

TECHNICAL

- ☐ Core Web Vitals pass on mobile 4G for homepage, match centre, and a representative programmatic page
- ☐ All indexed pages render fully with JavaScript disabled
- ☐ Score feed key held server-side only; verified absent from client bundle
- ☐ Feed failure states designed and tested — including a stale-data timestamp
- ☐ Coin ledger append-only, idempotent, and reconcilable
- ☐ Game outcomes server-authoritative
- ☐ Rate limiting on auth, contest entry, and coin endpoints
- ☐ DPDP: consent capture, data deletion endpoint, India-resident storage, grievance officer published

SEO

- ☐ Sitemap index live, segmented, and submitted to Search Console
- ☐ Canonicals correct across all programmatic templates
- ☐ Schema validated in Google's Rich Results Test
- ☐ Minimum-data threshold enforced with `noindex` on thin programmatic pages
- ☐ Gated and gameplay routes noindexed; lobby and game description pages indexed
- ☐ 301 map in place for any changed URLs

DESIGN

- ☐ Every component state delivered, including empty, loading, and error
- ☐ Contrast verified at 4.5:1 minimum across the dark palette
- ☐ Tabular figures applied to all live-updating numerals
- ☐ `prefers-reduced-motion` respected

- Touch targets at 44px minimum throughout

SECTION 15

Open Questions for the Client

These decisions block Phase 0 and should be resolved before any development budget is committed.

#	QUESTION	WHY IT MATTERS NOW
1	Is the brand name being changed, per Section 02?	Determines domain, logo, app store listing, and merchant registration. Changing it after launch means losing accumulated SEO authority — the exact problem this model is designed to avoid.
2	What is the total budget and the runway to first revenue?	Determines whether the game library is licensed or built, and whether Phase 1 ships with three games or eight.
3	Has an Indian gaming lawyer been engaged?	Required before Phase 1. The coin economy terms, contest prize structures, and the no-real-money policy all need review by someone who will put their name to it.
4	Web-first or app-first?	This document assumes web-first, which is correct if SEO is the primary channel. If the client's real priority is app installs, Phase 3 moves forward and the SEO investment reduces.
5	Is there an existing audience to migrate?	If the client currently operates any user base, the migration path and the messaging around the change of model need careful handling — and must not carry over any real-money expectations.
6	English only at launch, or English plus Hindi?	Hindi is one of the highest-return items in the SEO plan. Building bilingual from the start is far cheaper than retrofitting.
7	Who owns content production?	Match previews and reports within 30 minutes of a fixture requires either a small in-house team or a contracted agency. The SEO plan does not work without it.

A CLOSING NOTE FOR THE CLIENT

The original brief — a real-money cricket betting site targeting India — is not buildable lawfully as of May 2026, and the people most exposed under the current law are the operator, the marketer and the developer rather than the end user. What is described in this document reaches the same audience through the same channel, can be advertised and app-store listed, and builds a domain asset that appreciates rather than one that must be rebuilt every time it is blocked. It is a slower start and a considerably better business.

Disclaimer: This document is a design and technical specification, not legal advice. The regulatory summary in Section 01 reflects publicly reported information as of 23 July 2026 and the position may develop further. Engage a qualified Indian gaming lawyer to review the business model, terms of service, coin economy and contest structures before launch.
